

# Give Cold the High Five

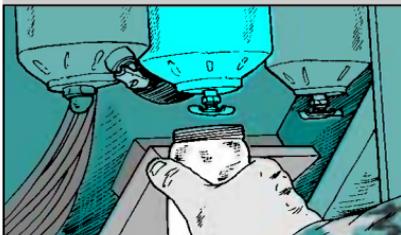

**K**ee your generator on the job during cold weather by giving it a helping hand. Here are five things you can

do: The generator set and the area around it should be free of ice and snow. Pay particular attention to the fuel tank cap and filler neck where snow and ice can become water in your fuel.

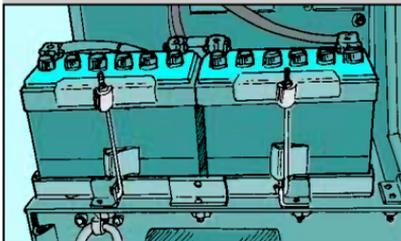

2. Keep fuel tanks full to protect against moisture, condensation and accumulation of water.

3. Drain and service fuel filters frequently to remove water and prevent freezing.

4. Keep batteries free from corrosion and in a well-charged condition. If possible, remove the batteries when not in use from the generator and store them in a heated area.

5. Do not bend or kink wiring that may have become brittle in the cold. Make all connections with care.
