

SPILLED OIL DAMAGES TRANSMISSION

Transmission oil belongs in your tank's transmission, not sprayed all over the engine.

Unfortunately, the filler neck is so small that spills often happen. A lot of that spilled oil gets blown by the cooler fans onto the oil cooler fins.

That oil residue attracts dirt and dust like a magnet. The goeey mess that forms on the cooling fins won't let the heat radiate away from the oil inside the coolers. That results in transmission damage.

Never add oil without a funnel. If your tank's oil funnel tip is broken or too large for the transmission filler opening, get a new funnel.

A flexible funnel does the best job. NSN 7240-00-559-7364 brings a box of 12.

Each funnel holds one quart, so use it carefully. Don't pour more than a quart into the funnel at one time or it'll overflow. If that happens, make sure you wipe up any spilled oil right away.
