COCKPIT AIR TEMPERATURES

If the environmental control system (ECS) air intake vent in your Longbow Apache's cockpit is blocked, pilots and gunners, you won't be able to stay cool or warm.

So if you don't want to swelter in the cockpit without air in the summer or freeze in the winter without heat, don't block the ECS air intake vent with your pubs bag.

A pubs bag blocking the intake vent leads to an overworked, burned-out fan motor. Reduced evaporator air flow can knock out the ECS. A broken ECS means no air to cool you down in the summer and no heat to keep you warm in the winter.

To maintain a comfortable cockpit, find another storage area for your pubs bag. Otherwise, you'll pop sweat in the heat or freeze in the cold.
