

# Painting Precautions

**W**hen you prep commercial construction equipment for the paint shop, you know you have to cover all the glass and lamp components—like the windshield, mirrors, headlights and taillights.

But you'll also need to cover all the polyethylene/plastic components that contain liquids—such as coolant overflow tanks and windshield washer reservoirs.

That's because you can't see through CARC to tell how much liquid is in the containers.

Just remember to cover the polyethylene/plastic as well as the glass items on your commercial construction equipment **before** it goes to the paint booth.
