

Stryker...

Do Not Shift on the Fly

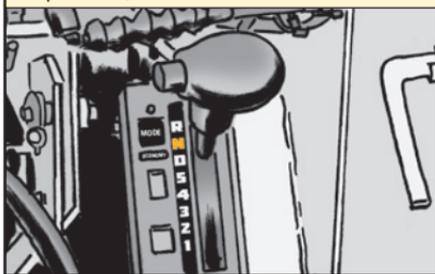

The transfer on your Stryker takes some getting used to, drivers. If you don't get used to it fast, though, you'll soon be buying a new one.

The transfer has three settings: 4-wheel drive, 8-wheel drive high, and 8-wheel drive low. You should **never** shift from one transfer setting to another while the vehicle is moving. That rips up the transfer case and the differentials.

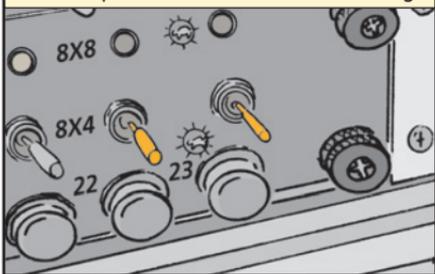

If you need to shift the transfer setting, always make sure the vehicle is completely stopped and the transmission is in neutral. You'll find this caution in WP 0023 00-11 of TM 9-2320-311-10-1.

Stop vehicle, shift transmission to neutral...
