MOD FOD

The modification team is responsible for all aspects of the modification, even clean-up. However, things get missed at times.

An aircraft can get a good workover when it's modified. Parts and components are removed from various places and new items are installed.

So whenever new equipment has been installed, the first thing you should do before flying your aircraft is a foreign object and debris (FOD) search of your bird from the nose to the rear.

It's a good maintenance practice to look for anything that was inadvertently left in your bird so FOD won't be your nightmare.
