

# Breaker Can Trip You Up

If the 5-KW generator on your command post carrier suddenly shuts down and won't restart, don't go running to your mechanic to complain.

You'll look kinda' foolish if the problem turns out to be nothing more than a tripped breaker.

A power surge from the carrier will sometimes trip the DC circuit breaker under the generator's control panel. When that happens, the generator is down for the count until you reset the breaker.

So, before you drag over that mechanic, try resetting the circuit breaker and restarting the generator.
