

# DON'T ADD OIL!!!

I JUST MIXED  
UP A GREAT  
DIESEL RECIPE  
FOR YOU!

NO! USING YOUR  
HOME BREW MEANS  
MY FUEL PUMP WILL  
*BURN UP!*

**JP-8** is a kerosene-based fuel that may break gunk and contaminants free from the sides of the vehicle's fuel tanks and lines.

After your vehicle makes the switch to JP-8, pay close attention to the engine. When it starts to idle or run rough, replace all the fuel filters. They're clogging up. The clogging should stop after two or three refuelings. JP-8 does run cleaner and leaner than diesel fuel, but that won't damage the engine. Some mechanics think it will.

They're adding oil to the vehicle's fuel tank when they refuel with JP-8. These "home brews" have also included adding power steering or brake fluid or transmission or engine oil to the vehicle's fuel system.

Adding any type of oil to JP-8 means it won't burn completely. Engine performance suffers, fuel filters clog up, and the fuel pump ends up working overtime—causing it to burn out!

Don't add oil to the fuel system.
