

A Little Hood PM Needed

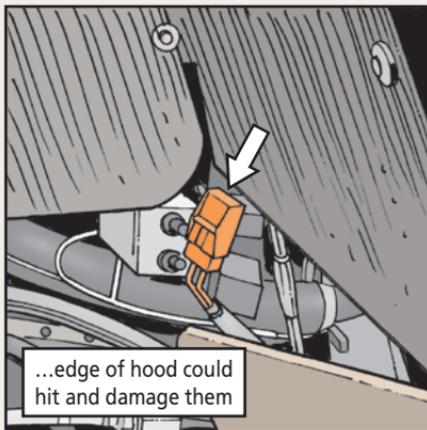

An extra set of hands are what's needed to raise or lower the hood on your M-ATV. That extra help prevents the stress cracks caused by flexing and keeps the hood from slamming shut.

Having a buddy on the other side also allows you to guide the hood past the bundle of electrical connectors on the driver's side. Otherwise, the hood might damage one or more connectors. A damaged connector for the vehicle's washer fluid reservoir, for example, means you can't wash a dirty window. That's a real bummer!

If bundle of connectors is hanging free...

...edge of hood could hit and damage them

As an added precaution, use a tie strap, NSN 5975-00-156-3253, to secure the connectors together to the cold start bracket and power steering line. That'll keep all of the connectors out of harm's way.
