

WHAT'S THE NEXT STEP FOR WRECKER LOAD TEST?

Dear Half-Mast,

I have been trying to load test an M1089A1 wrecker's material handling crane. But the maintenance support device (MSD) doesn't have a fault in the troubleshooting index for "crane fails load test."

Where do I go from here?

SFC T.D.S.

Dear SFC T.D.S.,

During the load test, there are notes that tell the tester to refer to "troubleshooting" to determine failure of the crane's overload protection system.

Enter "troubleshooting" and type in the serial numbers for the truck and transmission when prompted.

Next, select "electrical system" and "material handling crane."

Once you're in the MHC section, there are plenty of selections you can make.

Half-Mast
