

SIGHT ON SIGHT PROTECTION

If you leave your mortar's sight mounted at all times, your mortar will soon be sightless. Sights are often broken because Soldiers forget to remove the sight before settling the baseplate.

It doesn't take much of a knock to knock out the sight. And that's an expensive fix, not to mention the danger of tritium contamination from a broken sight.

Once the baseplate is settled, the sight can stay mounted during firing.

When the sight is not being used, secure it in its carrying case for protection.

Remember, the M67 or M64A1 sights contain tritium. If they're ever broken, immediately notify your safety officer. The entire mortar system may need to be tested for contamination.

Keep sight in case when you're not firing
